

DPF Revive™

**Aids in the Regeneration
of the DPF Core**

reviveturbocleaner.com

DPF Revive is formulated to assist the regeneration of the DPF core and is highly effective in maintaining DPF efficiency.

DPF Revive is particularly useful after a full Revive Engine clean has been carried out as the additional carbon deposits removed during this process will collect in the DPF. DPF Revive will assist in the fast removal of these particles ensuring the optimal flow of exhaust gas is maintained and will continue to assist in further regeneration processes as the soot particles build up through normal driving.

DPF Revive™

NEW

Revive DPF is a product which will encourage automatic regeneration to work at a lower exhaust temperature, making it much more likely to succeed without an extended drive cycle.

Once DPF Revive has been applied, the Nano Technology in the fluid attaches itself to soot in the DPF core and will activate as soon as the exhaust temperature reaches the required level, helping to prevent the DPF from becoming blocked.
